Plug & play solution  
for easier facility management

# MODULAR WATER TO WATER HEAT PUMP

## Plug & play solution for easier facility management

### The range in numbers

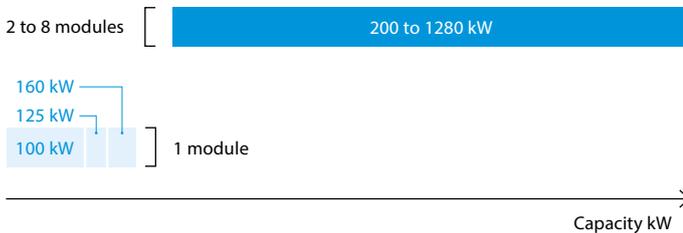

- 3** Product versions:
- Heat pump with inversion on water side
  - Heat pump with inversion on refrigerant side (100 kW only)
  - Condenser-less

- 3** Base modules: 100 – 125 – 160 kW

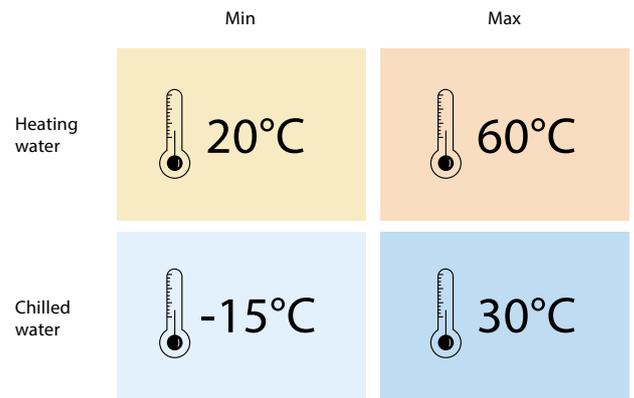

- 98** Possible combinations of modules with the different product versions

#### Capacity range

Three base modules of 100, 125 and 160 kW. Modules can be combined up to 8 in two stacked arrays of 4, with resulting capacity range **from 200 to 1280 kW**

#### Operating range

#### Product overview

- Indoor installation (xs)
- Outdoor installation (xr)
- Modular design
- Daikin VFD scroll compressors
- Braze plate heat exchangers
- R-32

The product features a new **modular approach** to system design, which introduces additional flexibility in configuration, allowing the required capacity to be reached by combining smaller units piped together and controlled as one. Consisting of three base modules with capacities of 100, 125 and 160kW, the range features **Daikin design** scroll compressors and R-32 refrigerant, whose GWP is 70% lower than that of R-410A. As well, R-32, being a pure and single component refrigerant, has all the characteristics needed to be easily recovered, recycled, or regenerated, so to enter the reclaimed refrigerant market and be reused. R-32 is also widely available on the market, as main refrigerant for air conditioning units with scroll compressors. That is, largely available for maintenance services.

The product is also available in two sound levels, including a reduced sound version suitable for outdoor installation and noise-sensitive applications such as residential buildings, hotels, and hospitals. Among the benefits, modular construction offers several advantages in siting and installation, making units easier to transport, handle, and install up to a fully plug-and-play solution by including the **Daikin Manifold Kit and Pump module**. Modules can be combined as a side-by-side array or stacked to minimise space requirements. Each of the different modules is very compact and can be easily transported and positioned in the installation space.

# Product Benefits

## Scalability & compactness

Due to its modularity, the new EW(W)(H)(L)T-Q A units offer high scalability potential. Modules can be added when needed, according to building's construction plan. As well, modules can be combined as a side-by-side array or stacked to minimise space requirements, particularly useful for retrofit applications. Modules

can be combined up to 8 in two stacked arrays of 4, with resulting capacity range **from 100 to 1280 kW**.

1

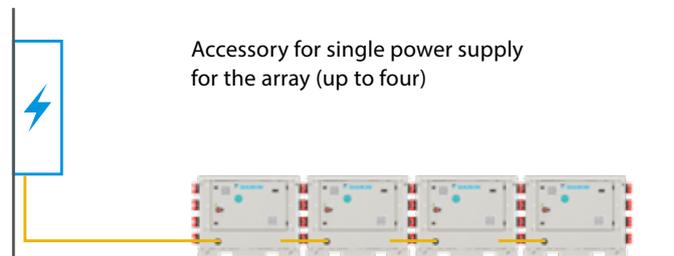

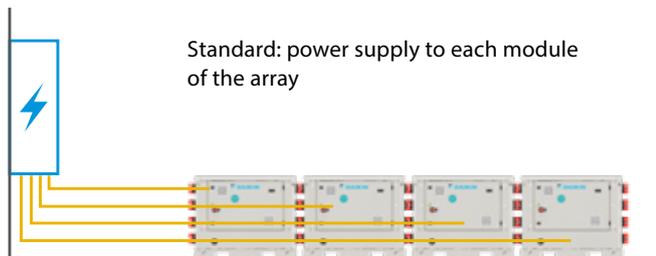

Max horizontal array: 4

Stackable up to 8 modules

## Single Power Supply

As standard (no accessory) each module must be connected to a separate power supply. It is possible to have a single array (up to four modules) with a single power supply.

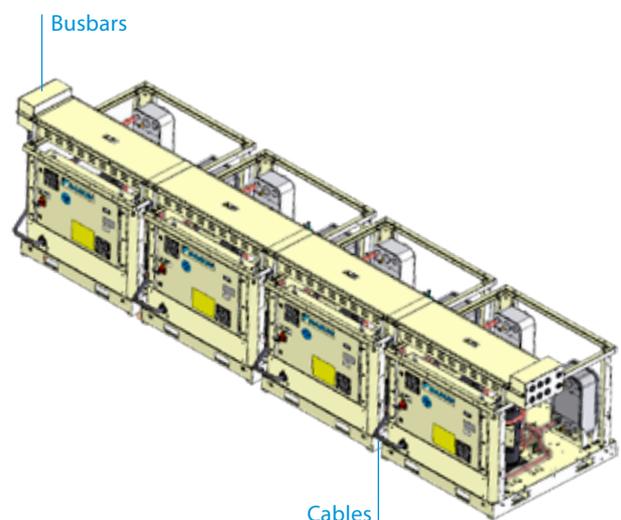

Busbars and cables are provided by factory with one of the below **accessories codes**. The electrical connection between modules must be done on site.

### Accessory codes:

- EKSPFLT2 - Single Power Supply Kit for 2 modules
- EKSPFLT3 - Single Power Supply Kit for 3 modules
- EKSPFLT4 - Single Power Supply Kit for 4 modules

### Attention:

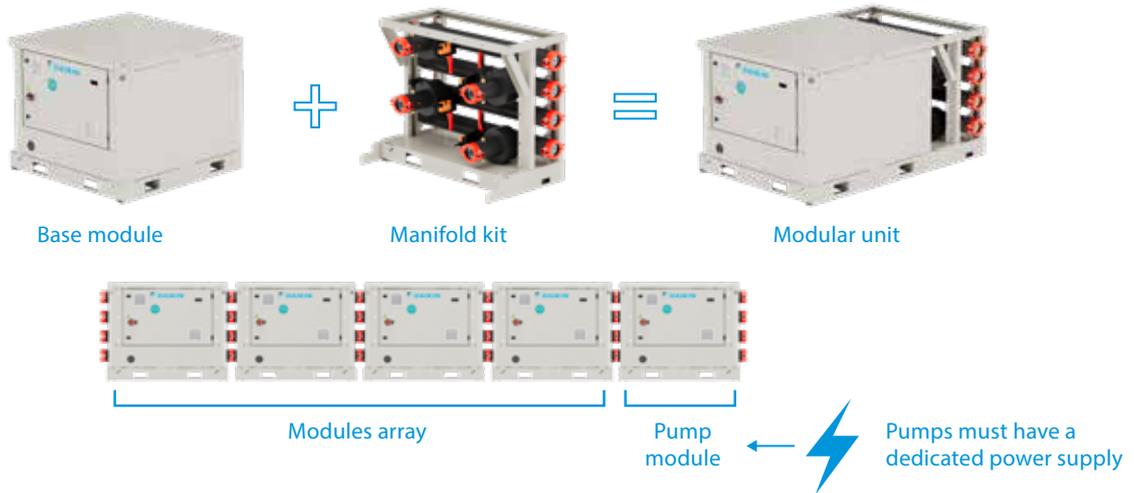

- Single Power supply kit is shipped loose and to be mounted on site
- The stacked installation is not compatible with single power supply configuration
- Single power supply available only for indoor installation
- In case of 4 units on order, to be arranged in array, in case single power supply is required, EKSPFLT4 can be selected just one time

**Plug & play installation**

Simplified installation with the Manifold Kit, which is designed to connect modules on the waterside, as it includes the pipework between the units. The Manifold Kit can also be factory-mounted to further reduce installation time on site. In addition, a dedicated Pump Module can be easily added to the array of modules. It is equipped

with inverter pumps for full flexibility and includes an 18-litre expansion tank. For further easiness of installation, Single Power Supply can be integrated, having 1 single power cable connected to the array of up to 4 modules (cables connecting modules provided by factory).

The modules can be installed indoor or even outdoor, if the reduced noise configuration would be selected. Indeed, the new EW(W)(H)(L)T-Q A offers two different noise configurations to comply with the requirements of noise sensitive applications as: residential, hotels and hospitals.

**Lower operating costs**

Thanks to its modular design, this new unit can closely follow the cooling and heating load profile of the building, according to EN14825. This is particularly important as it ensures low operating costs for the HVAC system at part load conditions, which represent most of the operating time. This is not the case with traditional packaged chillers & heat pumps, that need to work on a series of on-off cycles, reducing system efficiency.

Indoor installation

Outdoor installation

**Limited environmental impact**

The units use R-32 refrigerant, which has a Global Warming Potential (GWP) of 675, just one-third of R-410A. R-32 is a pure and single component refrigerant, so it can be reclaimed. A recent study from Tokyo City University\* reports that reclaimed R-32 has an environmental impact 90% lower than virgin R-32, due to avoided need of destruction and lower energy required for reclamation with respect to new production. Daikin uses reclaimed R-32 on its chillers and heat pumps under its Loop by Daikin programme.

**Contribution to Green Building**

The most popular green building protocols are BREEAM and LEED. EW(W)(H)(L)T-Q A can contribute to a project's credits when evaluating energy efficiency of the hydronic system, especially if Partial Heat Recovery option would be selected. The limited GWP of R-32 and the low refrigerant charge per circuit thanks to the modular design also result in a possible contribution when evaluating the impact of refrigerants.

# Product Applications

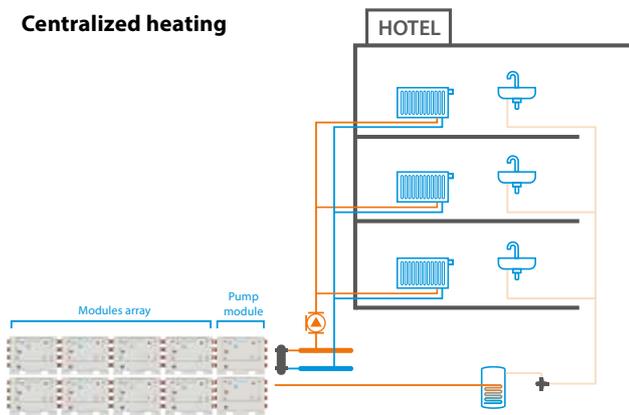

## Heating

### Space Heating + DHW configurations

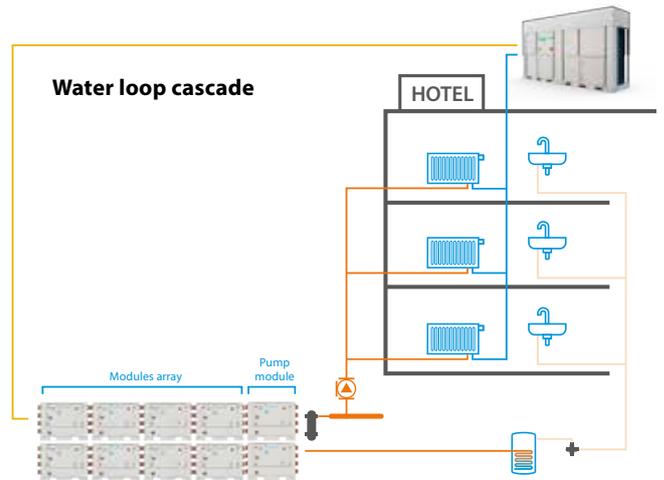

- Centralized heating, eventually in water loop cascade with an air to water heat pump. DHW supply managed via independent DHW supply (single or array of modules dedicated to DHW, eventually stacked). Units can be managed in master / slave up to an array of 4 modules per master

- Residential, offices, Light commercial, gym, hotel
- Replacement and new building
- Possible terminals:
  - Radiators (up to 60 °C)
  - Heating floor (30-35 °C)
  - Fan coils (45 °C)

#### Centralized heating

#### Water loop cascade

## Cooling

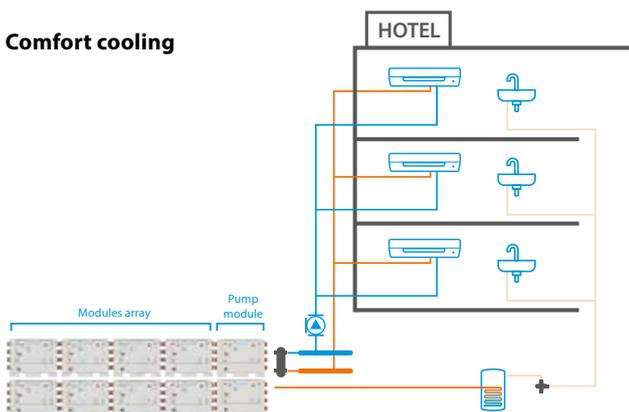

### Comfort cooling

- Centralized cooling. DHW managed via independent DHW supply (single or array of modules dedicated to DHW, eventually stacked). Units can be managed in master / slave up to an array of 4 modules per master
- Residential, offices, Light commercial, gym, hotel
- Replacement and new building
- Possible terminals:
  - Cooling floor (23-18 °C)
  - Fan coils (12-7 °C)

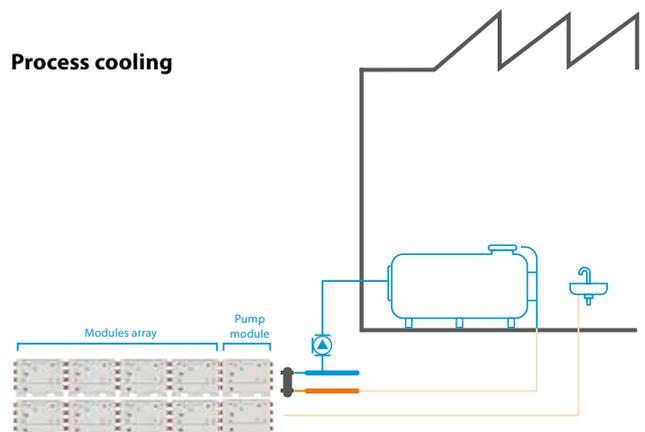

### Process cooling

- Dedicated or centralized cooling according to project's needs. Units can be managed in master / slave up to an array of 4 modules per master
- Milk cooling (9-4 °C)
- Refrigerated warehouse (-8 to -12 °C, with glycol)
- MRI cooling, and many others

#### Comfort cooling

#### Process cooling

## Plant water content

As a general indication, the system water content should not be less than the values deriving from the following formula:

Minimum water content per base module  $\rightarrow 5 \frac{It}{kW_{nominal}}$

$kW_{nominal} = \text{Cooling capacity at } 12/7^{\circ}\text{C} \mid 30/35^{\circ}\text{C}$

The above rule of thumb derives from the following formula, as the relative volume of water capable of maintaining the water temperature setpoint differential during the minimum load transient avoiding an excessive starts and stops of the compressor itself (which depends on the compressor technology):

Water volume =  $\frac{CC [W] * \text{Min load \%} * \text{DNCS} [s]}{FD \left[\frac{g}{L}\right] * SH \left[\frac{J}{g^{\circ}C}\right] * (DT) [^{\circ}C]}$

- CC = Cooling Capacity
- DNCS = Delay to next Compressor Start
- FD = Fluid Density
- SH Specific Heat
- DT = Water Temperature Setpoint Differential

A properly designed storage tank should be added if the system components do not provide sufficient water volume. By default, the unit is set to have a water temperature setpoint differential in line with Comfort Cooling and Heating application which allows to operate with the minimum volume mentioned in the previous formula. However, if a smaller temperature differential is set, as in the case of Process Cooling applications where temperature fluctuations must be avoided, a larger minimum water volume will be required. To ensure proper operation of the unit when changing the value of setting, the minimum water volume must be corrected.

In case of more than one installed unit, the overall capacity of the installation must be considered in the calculation so summing the water content of each unit.

- i) The above data are referred to the unit without additional optional.
- ii) The above data are referred the unit installed in compliancy with installation prescription.
- iii) All the data are subject to change without notice. For updated information on project base refer to Chiller Selection Software and unit's certified drawing.
- iv) Sound data in the Octave band spectrum and sound pressure over 1 m are based on calculation, thus intended as general guideline, and not considered binding.

Standard Rating Conditions for Water-to-Water chillers according to EN14511:2. Outdoor Heat exchanger inlet temperature 30°C, outlet 35°C; Indoor heat exchanger inlet temperature 12°C, outlet temperature 7°C. Fluid: water, fouling factor = 0 Sound Power levels are measured in accordance with ISO 9614. Sound Pressure at levels 1 meter are measured in accordance with ISO 3744
